- **How do I set the timer?**
  - **There are many different timers on the market that can be broke up into two types:**
    - Accumulating and Non-accumulating.
      - Accumulating means for every coin deposited, the timer will add that amount of time to the cycle for every coin deposited.
      - Non-accumulating means no matter how many coins deposited, the timer will only run for the amount of time that is set.
  - **All timers will start with a minimum amount of coins to begin the cycle.**
  - **For manual set timers, dip switches can be manipulated for both "coins to start" and "time per coin" (for accumulating) or "time" (for non-accumulating).**
  - **For display timers, remote controls to program work best, but manual programming can be achieved by following the manual to set coins and time per coin**
